PART I.

CHAPTER I.

HUMAN ANATOMY AND PHYSIOLOGY.

The author feels it necessary, before proceeding to a consideration of *Electro-Therapeutics*, to give in as comprehensive language as possible the anatomical structure and physiological organism which constitute life and health, or disease, in the human form, herein subsequently to be acted upon.

Assuming that the readers stand in the light of uninformed pupils, the effort on the part of the author will be directed to render as lucid explanations, and to give as wide a range of ideas upon these subjects as possible, without the perplexity of wading through technical nomenclature.

An organism is a body composed of separate parts called organs. It is definite in form and function, and each part or organ is necessary to the full perfection of the whole structure. Unorganized matter, on the contrary, is not necessarily made up of separate parts; it does not consist of organs, nor are the sizes and forms of inorganic masses limited or definite, except in respect to crystalline formations, which
