Mr. Gray evolved from these experiments the opinion that at least a portion of this electric current is generated by the action of the alkaline fluid on the sulphur and phosphorus contained in the liver and brain. Although the living body is known to have other sources of electricity, Mr. Gray believes that the prime agent in nervo-motor power is derived from the reaction of the brain and liver, especially in view of the fact that the kidneys excrete about 72 grains per diem of phosphoric acid, and of sulphuric acid nearly 100 grains are produced per diem, chiefly from the brain and liver.

Mr. Gray also advances the idea—which the author has every reason to corroborate, and has frequently declared in part explanation of her own discovery of Electrical Cranial Diagnosis—namely, that the sympathetic nerve, with its branches and ganglia, is not a separate or isolated system, but merely a constituent part of the general nervous system, having the function of regulating the movements of involuntary muscular fibre, and obtaining its nerve-force from the brain. He suggests an arrangement similar to that of the Leyden-jar, as occurring in the membranes inclosing the viscera, the lungs, the heart, and the great serous cavities of the body; whereas the author in a former volume has written, "I would liken the human organism not to a magnet, which has been done so often, but to a great natural battery, of which the lungs are the magnets, generating the electricity for the whole organism; the nerves, the wires or conductors; the heart, the helix or intensifying factor; the head and feet corresponding
