to the positive and negative poles. Conceive that the lungs generate the fluid from the oxygen of the atmosphere, and we have a never-failing electric reservoir, in which the slightest perturbation in the current produces, as is well known, a corresponding disturbance in the electric condition of the body; and as the electric forces resident in the various organs of the human body are simply modifications of those which vitalize human nature at large, it follows that any excess or diminution in their quantity, or any impoverishment in quality, may be supplied by a judicious administration of induced electricity. It is upon this basis the author's system of Electro-Therapeutics operates. Her theory of the electric force in its connection with the human organism recognizes it as the motor-power of the life principle."

Not to anticipate in this place the arguments which can be presented to support this theory, we will proceed to briefly consider the structure of the brain and nervous system, and see thereby how far we are justified in assuming that, in their operation, we find the instrumentalities through which the life-forces act.

It has long been believed that consciousness, intelligence, and will, find in the nervous matter of the brain the seat of those properties by which mind acts upon matter. As a full analysis of all that might be advanced in reference to the subtle links which connect mind and matter would involve psychological, as well as physiological, considerations, we must limit ourselves to the physical relations of our subject, alluding to its psychological connections only
