PNEUMOGASTRIC NERVE WITH ITS PRINCIPAL BRANCHES.

1. Pharyngeal branch.
2. Superior laryngeal branch.
3. Inferior laryngeal.
4. Pulmonary branches.
5. Stomach.
6. Liver.

FIG. 3.

Although this great nerve—at its origin sensitive—when ramified into its tributaries is considered extremely dull and comparatively non-sensitive, it contributes in its distribution of nervous force to both muscular coats and mucous membranes of the organs to which it relates. Its origin in the middle of the back portion of the medulla oblongata, and its direct distribution to four vital organs,—namely, the heart, lungs, stomach, and liver,—render it important.
