cord with eaeh other, and the cord itself with the ganglia of the brain.

The pairs of nerves given off from the spinal cord are larger where the nerves are distributed to the arms and legs; for instance, the eervical nerves whieh supply the arms, and the saeral nerves which supply the legs, are larger than the dorsal and lumbar nerves. By examination of Fig. 4, the philosophy of placing the electricity on the eervieal vertebra to affect the arms and shoulders can be eomprehended. Moreover; eonsidering that the eerebro-spinal system, eonsisting as it does of a series of ganglia sending out nerves to the eorresponding parts of the body and the spinal cord, supplies the integument and muscles of neek, trunk, and extremities with the ganglia of the brain, besides supplying the eorresponding parts of the head, presiding over the organs of the speeial sense, and performing various other functions of purely nervous eharaeter; the faet that the author's system of Eleetro-Therapeuties is so frequently addressed to the basilar region, and down the length of the vertebral eolumn, as the base upon whieh to work out a eure, is possessed of fundamental soundness, and evolved from purely physiologieal laws.
