2. Reflex action taking place from the sensitive surfaces, through the cerebro-spinal and sympathetic systems, to the involuntary muscles and secreting organs. Imprudent exposure of the integument to cold and wet will often induce diarrhœa. Mental and moral impressions, conveyed through the spinal senses, will affect the motions of the heart and disturb the processes of digestion and secretion. Terror, or an absorbing interest of any kind, will produce a dilatation of the pupil, and communicate in this way a peculiarly wild and unusual expression to the eye. Disagreeable sights, odors, or even unpleasant occurrences, are capable of hastening or arresting the menstrual discharge, or of inducing premature delivery.

3. Reflex actions taking place through the sympathetic system, from one part of the internal organs to another. The contact of food with the mucous membrane of the small intestine excites a peristaltic movement of the muscular coat. The mutual action of digestive, urinary, and internal generative organs upon each other takes place through the medium of the sympathetic ganglia and their nerves. The variations of the capillary circulation in different abdominal viscera, corresponding with the state of activity or repose of their associate organs, are to be referred to a similar nervous influence. These phenomena are not accompanied by any consciousness on the part of the individual, nor by any apparent intervention of the cerebro-spinal system.
