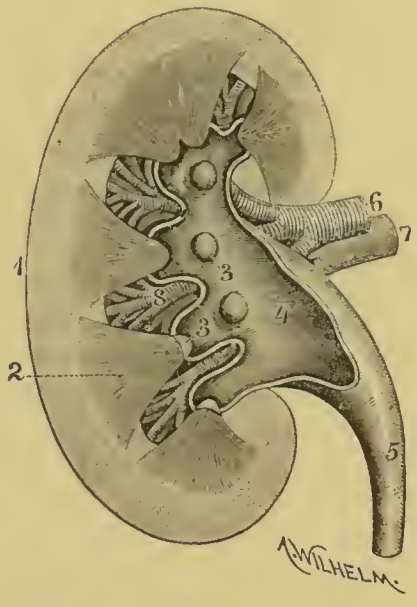
LONGITUDINAL SECTION OF A KIDNEY.

1. Cortical substance.
2. Renal pyramid.
3. Renal papillæ.
4. Pelvis.
5. Ureter.
6. Renal artery.
7. Renal vein.
8. Branches of the latter vessels in the sinus of the kidney.

FIG. 11.



The kidneys are two glandular organs deeply situated in the lumbar region; lying one on each side of the vertebral column, the right a little higher than the left. They are opposite the upper two or three lumbar and the last dorsal vertebræ, inclining toward each other above, and are maintained in this position by their vessels, together with a quantity of loose areolar tissue usually containing much fat. Their anterior surface is more convex than the posterior, and their upper extremity is larger than the lower, and has attached to it the supra-renal body.

The right kidney in front is in contact with the liver, the descending portion of the duodenum, and the ascending colon; the left with the spleen, pancreas, stomach, and descending colon.

The kidneys are smooth, dark red, compressed oval bodies with a notch on the inner side; the form being so characteristic that similar-shaped bodies are com-
