two of which are furnished with each battery, may be employed, covered or not with a thin sponge, always wet. When it is to be administered through the person of the operator, which makes the electricity highly *electro-magnetic*, the current should pass mainly from left to right. Excess causes debility to the operator, antidoted by passing the same current from right to left; upward and downward are also mutually antidotal. The maplewood sponge-cup, of about two and one-half inches diameter, with a handle some six inches long (see cut), is held in the left hand of the operator or patient, as the case may be, the right being used to give off the positive to the patient; although the practice of conveying electricity through the operator to the patient is considered, as a rule, exceedingly prejudicial to the former, and the same benefits can be obtained by the direct use of the sponge-cup on the patient. This sponge-cup is very useful in the treatment of numerous maladies. Besides these, many forms of electrodes may with ingenuity be extemporized when peculiarities in cases demand special contrivances. A great variety of appliances are handsomely made and sold by dealers in surgical and electrical apparatuses, which every practitioner should possess (see diagrams), many of which prove indispensable for the treatment of internal parts, as the bladder, uterus, rectum, nose, ear, etc. The glass eye-cup and the metallic brush are included. A foot-tub is requisite for various purposes, also a basin (ordinary toilet appurtenances can be utilized), and a number of pieces of rubber cloth, of different sizes, for protection of the clothing against dampness.
