be given (except when some peculiar emergency demands reversal) from the base of brain down the spine; or—if given on the epigastric region—as directed. In some cases the patient can be more conveniently reached if standing.

The patient should sponge off in tepid or quite cool water, and rub thoroughly in the bath-cabinet after the vapor has been shut off. Some patients allow the attendant to thoroughly rub them with coarse crash towels, then emerge, don their clothing rapidly, and exercising due care to AVOID DRAUGHTS, may go out as soon as cooled off sufficiently to denote reaction. For the first attempts with the vapor-bath, it will be advisable to shun lowering weather and general negative conditions of the atmosphere.

Instead of producing a debilitating effect, as the uninformed might anticipate, when one has taken a brief rest after the fatigue of dressing the effect is truly exhilarating. The author personally can commend the efficacy of the vapor-bath when weariness and cold are settling upon the physician exposed to inclement weather. Frequently a vapor apparatus has been most ingeniously devised in an emergency.

It is remarked that the dynamic and molecular movements in bodies traversed by electric currents tend to pursue the routes of such currents. The platinum point, for instance, upon which the trembler plays in vibrating, has been found excavated after prolonged use, and a corresponding little metallic bead deposited on the plate below. So, also, after a treatment, mercury has been found in the
