AFFECTIONS OF THE EYES.

Disordered vision.

First. Place the round electrode in the hands of the patient in A, the sponge-cup on the eye or eyes if both are affected, in C or D, very mild in strength (using A–C current for sensory, and A–D current for motory affections).

Second. Wet the hair at the back of the head, and use a sponge-cup or cylinder electrode enclosed in a sponge at the base of brain in C, stroking upward an inch or two on the head, using the current strong enough to produce a lifting sensation in the scalp, a sponge-cup held by the patient with a light pressure on the eyes alternately in D, three to five minutes each eye.

Weak eyes. In weakness of the nerves or tendency to paralysis of the nerves,

First. Apply sponge-cup lightly on the eye, rubbing outward in A, No. 3 electrode back of the neck on the spine in C, not strong enough to produce pain.

Second. Alternate this every other day with F–H current.

Conjunctivitis.

First. The eye-cup filled with warm water or milk (the face must be held downward; the eye may be opened in the cup) in C, No. 2 electrode or the sponge-cup at the base of brain in B, five minutes. If both eyes are affected, change the water, rinse the cup, refill it for the other eye, and apply as before.

Second. Use C–E current in the same manner.
