connect; reapply sponge to right ovary, reassuring the patient, and cautioning her to keep the arms down; and proceed as before; five to seven minutes.

Third. Disconnect as before, and reapply over the uterus itself.

Do not continue longer at either point than seven minutes, nor after contraction ceases. If this be neglected, great soreness may ensue, and retard the cure, even requiring to be antidoted.

THE IMPROVED METHOD FOR DISPLACEMENTS.

First. Place No. 4 electrode, with the operator's right hand upon it, over the organ prolapsed in D, No. 5 electrode from the coccyx upward on the spine in A; attach the conducting-cords to the battery, and draw the cylinder out quickly, and return it as soon as the operator feels the organ assume its normal position. One treatment will accomplish this.

Second. No. 6 electrode across the abdomen in E, and change No. 5 electrode to C, and apply gently for twenty minutes. Immediately after the treatment, an Electric Abdominal Supporter should be fitted to the patient, to be worn during the day for several months, and thoroughly aired at night. Daily treatments should be taken, always a local manipulation and usually a general treatment, according to symptoms.

Not less than four days of consecutive treatment must be stipulated for, at the commencement, with all old cases, as this is needed to be effective, although the immediate effect is often very marked after a single treatment.
