we cannot do better than to quote here the description of this disease by the late Prof. N. Chapman:

"The cheeks are hollow, the bones prominent, the skin arid, the nose sharpened and drawn, the eyes sunken, with the adnata of a pearl color, destitute of vascularity, the lips retracted, so as to produce a bitter smile, and the hair thinned by falling out, the neck wasted, oblique and somewhat rigid or immovable, the shoulder-blades projected or winged, the ribs naked or exposed, with diminution of the intercostal spaces, and the thorax apparently narrowed; the abdomen flat, the joints, great and small, seemingly enlarged from the wasting of the integuments, the nails livid, and occasionally incurvated, the extremities œdematous; the angular points on which the body rests, in several points protruded through the skin,—the whole attended by a most afflicting cough, aphthæ, sore throat, difficult deglutition, and feeble, whispering voice, or entire extinction of it."

C., Generally hereditary taint, most frequently found nearest sea-level. High, dry, and equable climates most exempt from it, even when cold. The disease is never found in Arctic countries, and is more prevalent in the Southern than the Northern States. Impure air, sedentary employments, excesses of all kinds, and everything that depresses vital forces are predisposing causes.

ORGANS OF CIRCULATION.

Pericarditis.—*D.*, Inflammation of the investing membranes of the heart; *V.*, primary and rheumatic; *S.*, fever, radiating pains from the heart, tenderness on pressure, pulse rapid, feeble, and irregular, short hacking cough, countenance anxious, sometimes nausea and vomiting, frequently delirium; as the end approaches, face livid and swollen, so also the hands and feet; *C.*, most commonly rheumatic fever, gout, and Bright's disease of the kidneys are also assigned as causes for it, but the proof does not seem to be clear.

Endocarditis.—*D.*, Inflammation of the lining membrane of the heart. Symptoms and causes same as in pericarditis.
