(When the patient lies on the thorax, this cavity is *compressed* by the weight of the body, and expiration takes place. When he is turned on the side, this pressure is removed and inspiration occurs.)

6. When the prone position is resumed, make a uniform and efficient pressure *along the spine*, removing the pressure immediately, before rotation on the side. (The pressure augments the expiration; the rotation commences inspiration.) Continue these measures.

7. Rub the limbs *upward*, with *firm pressure* and with *energy* (the effect being to aid the return of venous blood to the heart).

8. Substitute for the patient's wet clothing, if possible, such other covering as can be instantly procured, each bystander supplying a coat or cloak, etc. Meantime, and from time to time, to *excite inspiration*, let the surface of the body be *slapped* briskly with the hand.

9. Rub the body briskly till it is dry and warm, then dash *cold* water upon it, and repeat the rubbing.

Avoid the immediate removal of the patient, as it involves a *dangerous loss of time*,—also the use of bellows, or any *forcing* instrument, also, the *warm bath*, and all *rough treatment.*
